

Flying Wires

This document is meant to be a comprehensive gathering and storage site of information pertaining to flying wire geometry

To begin with, the geometry of the wires is defined. Then follows, in tabular form, the parameters associated with the individual wires. (Note that the aperture numbers in this document (X_+ , X_- , Y_+ , Y_-) are circumstantial values that are set the fly specifications and are included here simply as examples.) Lastly, diagrams have been included to give a visu explanation of each flying wire setup.

If you would like to view photos of the flying wire setup for particular wire, please refer to one of the following files:

- MI photos (MI10H,V)
- RR photos (MI62H,V)
- TEV photos (E17H,E11H,V)
- PBAR photos (COREH,760H,TAILH)
- PBAR photos (COREV,760L)
- PBAR photos (COREV,TAILV)

Flying Wire Coordinates (H)

Horizontal wire -- measures transverse beam density profile as it rotates in a horizontal circle

EQUATIONS

$$\theta = \theta_0 + K_E \theta_E$$

$$X = X_0 + r \sin \theta$$

DEFINITIONS

θ = angle

θ_0 = encoder reference angle

K_E = encoder constant,

$K_E = \pm 2\pi/N$ (where N is # of counts per rotation)

θ_E = encoder counts

X_0 = wire offset

r = rotation radius

Flying Wire Coordinates (V)

Vertical wire -- measures longitudinal beam density profile as it rotates in a vertical circle

DEFINITIONS

θ = angle

θ_0 = encoder reference angle

K_E = encoder constant,

$K_E = \pm 2\pi/N$ (where N is # of counts per rotation)

θ_E = encoder counts

Y_0 = wire offset

r = rotation radius

EQUATIONS

$$\theta = \theta_0 + K_E \theta_E$$

$$Y = Y_0 + r \sin \theta$$

A	B	C	D	E	F	G	H	I
